Place: Bangalore

ACKNOWLEDGEMENT

Behind every success, there is a driving force that motivates and inspires. I feel blessed when I say that I had not one but many sources of inspiration. I want to take this opportunity to thank each one of them in this section of the project.

First and foremost I would like to pay my humble gratitude to **Prof. Shanti. J** , who has been a teacher, mentor and guide to me throughout my first year in college. I was fortunate to study under her and got to learn immensely. She believed in me and expected nothing but the best from me. She is responsible for the level of quality in my work that I have attained today.

Secondly, I want to thank **Amity, Bangalore** for having given me this opportunity to work and gain valuable experience through an Organizational Study in a private limited company.

I am always thankful to God for giving me **parents** who have stood by my side through thick and thin. They have always motivated, inspired and guided me, shown me right from wrong and instilled in me the power of being rational. I would not be what I am today if it wouldn't have been for my parents. I owe the success of my project report to these people.

INTRODUCTION

INTRODUCTION

MARKETING

Marketing refers to activities a corporation undertakes to market the buying or selling of a product or service. Marketing includes advertising, selling, and delivering products to consumers or other businesses. Some marketing is completed by affiliates on behalf of a corporation.

Professionals who add a corporation's marketing and promotion departments seek to urge the eye of key potential audiences through advertising. Promotions are targeted to certain audiences and

should involve celebrity endorsements, catchy phrases or slogans, memorable packaging or graphic designs and overall media exposure.

Marketing as a discipline involves all the actions a corporation undertakes to attract customers and maintain relationships with them. Networking with potential or past clients is a component of the work too, and should include writing many thanks emails, playing golf with prospective clients, returning calls and emails quickly, and meeting with clients for coffee or a meal.

At its most elementary level, marketing seeks to match a company's products and services to customers who want access to those products. Matching products to customers ultimately ensure profitability.

Product, price, place, and promotion are the Four Ps of selling. The Four Ps collectively structure the essential mix a corporation must market a product or service. Neil Borden popularized the thought of the marketing mix and therefore the concept of the Four Ps within the 1950s.

CONSUMER PREFERENCE

Consumer preference refers to the tendency to love or favor something over other alternatives. If you purchase an iPhone rather than Galaxy Smartphones, you've got a preference for the iPhone. during this case, preferences are a mirrored image of customer loyalty, brand strength, and successful marketing tactics.

In economics, consumer preferences are linked to how consumers buy goods and services. Individual preferences are often built into utility functions of varied bundles of products. Consumers rank the bundle of products consistent with the extent of utility.

Changes in preferences affect the extent of demand for various goods. Knowing and understanding customer preferences is significant for marketing success. Companies should anticipate customer needs or adapt existing products to create stronger experiences. That way, they will sell more profitably.

Consumer preferences can change thanks to changes in fashion, habits, and other factors. For this reason, companies can build consumer preferences by combining various elements of the marketing mix.

Consumer theory is that the study of how people plan to spend their money supported their individual preferences and budget constraints. A branch of microeconomics, consumer theory shows how individuals make choices, subject to what proportion income they need available to spend and therefore the prices of products and services.

Understanding how consumers operate makes it easier for vendors to predict which of their products will sell more and enables economists to urge a far better grasp of the form of the general economy

Individuals have the liberty to settle on between different bundles of products and services. Consumer theory seeks to predict their purchasing patterns by making the subsequent three basic assumptions about human behavior:

Utility maximization: Individuals are said to form calculated decisions when shopping, purchasing products that bring them the best benefit, otherwise referred to as maximum utility in economic terms

No satiation: People are seldom satisfied with one trip to the shops and always want to consume more

Decreasing marginal utility: Consumers lose satisfaction during a product the more they consume it

Working through examples and/or cases, consumer theory usually requires the subsequent inputs:

A full set of consumption options

How much utility a consumer derives from each bundle within the set of options

A set of costs assigned to every bundle

Any initial bundle the buyer currently holds

CONSUMER ATTITUDE

Consumer attitude could also be defined as a sense of favorableness or unfavorableness that a private has towards an object. As we, all know that a private with a positive attitude is more likely to shop for a product and this leads to the likelihood of liking or disliking a product.

Consumer attitude basically comprises of beliefs towards, feelings towards and behavioral intentions towards some objects.

Belief plays an important role for consumers because, it is often either positive or negative towards an object. for instance, some may say tea is sweet and relieves tension, others may say an excessive amount of tea isn't good for health. Human beliefs aren't accurate and may change consistent with situations.

Consumers have certain specific feelings towards some products or brands. Sometimes these feelings are supported certain beliefs and sometimes they're not. for instance, a private feel uneasy when he eats cheese burst pizza, due to the tremendous amount of cheese or fat it's.

Behavioral intentions show the plans of consumers with reference to the products. this is often sometimes a logical result of beliefs or feelings, but not always. for instance, a private personally won't sort of a restaurant, but may visit it because it's the hangout place for his friends.

Functions of Attitudes

The following are the functions of attitudes

Adjustment Function – Attitudes helps people to regulate to different situations and circumstances.

Ego Defensive Function – Attitudes are formed to guard the ego. We all are bothered about our self-esteem and image therefore the product boosting our ego is that the target of such a sort of attitude.

Value Expression Function – Attitudes usually represent the values the individual possesses. We gain values, though our upbringing and training. our worth system encourages or discourages us to shop for certain products. for instance, our worth system allows or disallows us to get products like cigarettes, alcohol, drugs, etc.

Knowledge Function – Individuals' continuously seeks knowledge and knowledge. When a private gets information a few particular products, he creates and modifies his attitude towards that product.

Models of Attitude

The following are the models of attitude

Tri-component Model – consistent with tri-component model, attitude consists of the subsequent three components.

Cognitive Component – the primary component is cognitive component. It consists of an individual's knowledge or perception towards few products or services through personal experience or related information from various sources. this data, usually leads to beliefs, which a consumer has, and specific behavior.

Affective Component – The second part is that the affective component. This consists of a person's feelings, sentiments, and emotions for a specific brand or product. They treat them because the primary criteria for the aim of evaluation. The state of mind also plays a serious role, just like the sadness, happiness, anger, or stress, which also affects the attitude of a consumer.

Behavioral Component – The last component is Behavioral component, which consists of a person's intention or likelihood towards a specific product. it always means the particular behavior of the person

Chapter 1.1

INDUSTRY PROFILE

NETFLIX

Netflix is synonymous to a video platform. it's revolutionizing the way people watches Movies & TV shows. In earlier time people want to watch shows & programs employing a cable network. But now the way they watch tends to vary rapidly day by day. Netflix is considered the primary major disruption of television, forcing cable companies to vary the way they are doing business. Timeline of Netflix history shows how the video content we consumed is revolutionizing over the years.

By providing video-on-demand content, creating compelling original programs, using user data to raised serve customers and letting customers consume content within the way that they like. Netflix has a consequence on the remainder of the broadcasting industry. Historical success of Netflix within the TV industry seems to be forcing the cable company to vary the way they operate their business.

HOW DID NETFLIX BEGIN?

Netflix was first founded in August of 1997 by two serial entrepreneurs Marc Randolph and Reed Hastings. the corporate began in Scotts Valley, California and has grown to become the world's leading internet entertainment platform. When it first opened, Netflix was purely a website-based movie rental service. It allowed people to rent DVDs online. Users would put within the the orders and receive a DVD in the post. When they'd finished with them, they simply posted them back to posted them back to Netflix. In October 2019 it had over 151 million paid subscribers in over 190 countries round the world. It offers a good range of TV series, documentaries, and have films across a good sort of genres and languages.

NETFLIX IS 20 YEARS OLD!

When Reed Hastings and Marc Randolph founded Netflix (formerly referred to as Kibble) in 1997, the corporate seemed to be little quite an upstart DVD rental business whose only real value proposition was the mail-order element of its operation. Fast forward 20 years and Netflix has become one among the most important TV and movie studios within the world, with more subscribers than all the cable TV channels in America combined. How did Netflix go from renting movies to creating them in only 20 years?

For Netflix, however, doing the apparent rarely meant taking the straightforward answer. It meant making business decisions that were so difficult then ambitious, few people could even see them, including understand them. Netflix has innovated in several key ways. They started with a frictionless DVD rental business facilitated by the web, developed a completely new streaming business from scratch, and eventually invested in original content creation. But many of the foremost pivotal moves Netflix has made during the past 20 years haven't been all that surprising. As we'll see, it makes perfect sense that Netflix became a movie studio. It just didn't look that way to most of the people within the beginning.

Reed Hastings

Reed Hastings co-founded Netflix in 1997. In 1991, Reed founded Pure Software, which made tools for software developers. After a 1995 IPO, and a number of other acquisitions, Pure was acquired by Rational Software in 1997.

Reed is a lively educational philanthropist and served on the California State Board of Education from 2000 to 2004. he's currently on the board of several educational organizations including KIPP and Pahari. Reed is additionally a member of the town Fund.

Marc Randolph

Marc Randolph may be a "veteran Silicon Valley entrepreneur, advisor, and investor. As co-founder and founding CEO of Netflix, he laid much of the groundwork for a service that's grown to 150 million subscribers and fundamentally altered how the planet experiences media.

He also served on the Netflix board of directors until retiring from the corporate in 2003." - marcrandolph.com.

He graduated with a degree in Geology and would continue to found and run various mail-order and direct-to-customer companies.

Throughout Marc's career, he founded no but six successful startups, including the magazine Macworld, and has mentored many early-stage entrepreneurs.

Chapter 1.2

COMPANY PROFILE

When and where was Netflix founded?

As previously mentioned, Netflix was founded in 1997 in Scotts Valley, California. It had been originally a rent-by-mail DVD service that used a pay-per-rental model.

Users would browse and order the films they wanted on their website, put in an order, and Netflix would post them to your door. After renters had finished with the DVDs, they might simply post them back.

Rentals were around \$4 plus a \$2 postage charge. After significant growth, Netflix would switch to a subscriber-based model.

With this model, users could keep the DVDs for as long as they liked but could only rent a replacement movie after returning their existing one.

They would eventually introduce a streaming model in 2010 that we all know today.

Netflix's model would directly challenge the market dominance of rental giants like Blockbuster at the time. As we all know today, Blockbuster couldn't compete and filed for bankruptcy in 2010.

But this never needed to happen. Years before, Blockbuster could have actually partnered or maybe bought Netflix out.

"In 2000, Netflix CEO and co-founder Reed Hastings approached Blockbuster a few partnerships. Unfortunately for Blockbuster, their CEO just smiled and laughed at him.

In fact, Blockbuster even had an opportunity to get Netflix for \$50 million. Netflix currently features a Market Cap of [116.42B] (2019) and a share price of \$331.89, while Blockbuster is out of business." - rewindandcapture.com.

Why is Netflix called Netflix?

You may, or might not, are ready to work this out for yourself. But just in case you're still stumped, the name Netflix may be a combination of "Net" (common parlance abbreviation of the internet) and "Flax" (a common abbreviation of "flicks" which successively is slang for a movie or film).

How was Netflix found?

At the time Netflix was founded, Marc was working as a marketing director for Hasting's company Pure Atria. He was also the co-founder of Microarousal (a computer mail-order company).

Hasting would later sell Pure Atria to the Rational Software Corporation in 1997 for \$700 million.

By all accounts, the pair came up with the thought for Netflix during a commute between their homes in Santa Cruz and Pure Atria's HQ in Sunnyvale before Pure Atria's acquisition and merger.

Reed would supply the seed capital and invested \$2.5 million into the startup in cash. Inspired by Amazon's e-commerce model, the pair explored various portable items they might use to sell over the web during a similar fashion.

After initially considering and rejecting VHS cassettes, they settled on DVDs because the perfect product. After testing their idea by posting one to their homes in Santa Cruz, and it arriving in perfect condition, they decided the time was right to interrupt into the market with their new revolutionary model.

Netflix launched in April of 1998 and have become the world's first online DVD rental and merchant. that they had only a couple of tens of staff and slightly below 1000 titles at the time.

Timeline of Netflix Evolution

The image shows the classic Netflix logo, which consists of the word "NETFLIX" in a bold, white, sans-serif font. Each letter is three-dimensional, with a black shadow cast to the right, giving it a 3D effect. The logo is centered on a light gray background.

2000-2014

1997 – Two software engineer Reed Hastings & Marc Randolph co-founded Netflix. At very first, service was to offer online movie rentals. A renter can get them through using mail service.

1998 – Netflix launched the first DVD rental and sales site, netflix.com. It was based on pay-per-rental-model.

1999 – Netflix introduced a monthly subscription service, offering unlimited DVD rentals at a very low monthly price.

2000 – Netflix introduced a personalized movie recommendation system. In this system, a user-based rating helps to accurately predict choices for all Netflix members.

2002 – Netflix announced its initial public offering (IPO on Nasdaq under the ticker “NFLX” with 600,000 members in the US.)

2003- Netflix announced that it reached 1 million subscribers in the United States.

2005 – The number of Netflix members rises to 4.2 million. It was the rapid increment of members compared to past years.

2006- Netflix offered a \$1 Million prize to the first developer of a video-recommendation algorithm that could beat its existing algorithm.

2007 – Netflix introduced Online streaming services, which allows members to instantly watch television shows and movies on their personal computers.

2008 – Netflix collaborates with consumer electronics companies to stream on the Xbox 360, Blu-ray disc players and TV set-top boxes. Like Hulu, a competing online streaming service launches for public access in the United States.

2009 – Netflix partners with consumer electronics companies to stream on the PS3, Internet-connected TVs, and other Internet-connected devices.

2010 – Netflix is available on the Apple iPad, iPhone and iPod Touch, the Nintendo Wii, and other Internet-connected devices. Netflix officially launched its service in Canada. Later on, Netflix started expanding its streaming service to the international market.

2011 – Netflix officially launched its streaming services throughout Latin America and the Caribbean.

2012 – Netflix became available in Europe including the United Kingdom, Ireland and in the Nordic Countries. Netflix wins its first Primetime Emmy Engineering Award.

2013 – Netflix expanded to the Netherlands. Netflix launched its first slate of original TV shows including House of Cards, Hemlock Grove, Arrested Development and Orange is the New Black.

2014 – In 2014 Netflix launched in Europe including 6 new countries (Austria, Belgium, France, Germany, Luxembourg, and Switzerland). Netflix receives 31 Primetime Emmy nominations including outstanding drama series, comedy series and documentary or nonfiction special for “House of Cards”, “Orange is the new black”, and “The Square” respectively. House of Cards won three Primetime Emmy Awards. Netflix was the first internet TV network nominated for the Primetime Emmy. Netflix now has over 50 million members globally.

2015 – Netflix officially launched in Australia, New Zealand, and Japan, with continued expansion across Europe in Italy, Spain and Portugal. Netflix first original featured film was “**Beasts of No Nation**” released in 2015.

2016 – Netflix became available worldwide. Netflix launched in 130 countries bringing their global entertainment service to 190 total countries around the world. Netflix premiered “**Stranger Things**”, which became an acclaimed and award-winning worldwide phenomenon.

2017 – Netflix won its first Oscar, with “**The White Helmets**” for Best Documentary Short Subject. It hits 100 million members globally. A study showed that the number of Netflix subscribers now equal that of all the cable subscribers combined; 73% of all US households.

2018 – Even more, Netflix wins Oscar for Best Documentary Feature for Icarus. It announced overall deals with Ryan Murphy, Kenya Barras, Jason Bateman. Netflix premiered international originals from Denmark (The Rain), India (Sacred Games), Mexico (La Casa de las Flores) and Spain (La Casa de Papel, Elite). Similarly, it becomes the most nominated service at 2018 Primetime and Creative Arts Emmy Awards with 112 nominations. Ties with HBO for most wins taking home 23 accolades for series include Godless, Seven Seconds, GLOW, and Queer Eye.

Netflix Subscriber Over the Years!!!

According to Statistica.com, within the half-moon of 2019, Netflix had over 148 million paying streaming subscribers worldwide. Even more, it's over 6.56 million free trial customers, of those subscribers, 60.23 million were from the us. Below statistical report presents data on the amount of Netflix paying streaming subscribers worldwide from the third quarter of 2011 to the primary quarter of 2018.

With over 148 million paid memberships in over 190 countries enjoying TV series, documentaries and have films across a good sort of genres and languages. the recognition of Netflix's streaming service has increased massively over the years. Members can watch the maximum amount as they need, anytime, anywhere, on any Internet-connected screen. Members can play, pause and resume watching, all without commercials or commitments.

Current Net Worth of Netflix

According to Crunchbase, a number one platform for locating business information about private and public companies. Netflix net worth as of June 06, 2019 is \$155.53B. it's registered under the ticker NASDAQ: NFLX. Their stock opened with \$15.00 in its May 23, 2002, IPO. Netflix has raised a complete of \$3.1B in funding over 10 rounds.

Their latest funding was raised on Apr 24, 2018, from a Post-IPO Debt round. Netflix is funded by 7 investors. TCV is that the most up-to-date investors. Netflix has acquired 2 organizations. Their most up-to-date acquisition was Storybooks on May 9, 2019. Netflix has \$16.6B in estimated revenue annually. Netflix competes with HBO, Apple, and Hulu.

With the decline within the viewership of television, per annum and rise of internet TV platform Netflix is currently standing at a robust position with its business model. But it must innovate itself and make it relevant within the marketplace. The presence of competitors like amazon prime videos, influx, HULU, YouTube and DirecTV still directly impact Netflix growth.

Chapter 2

LITERATURE REVIEW

Literature review

The underlying foundation of demand, therefore, may be a model of how consumers behave. The individual consumer features a set of preferences and values whose determination are outside the realm of economics. They're little question dependent upon culture, education, and individual tastes, among a plethora of other factors. The measure of those values during this model for a specific good is in terms of the important cost to the buyer who purchases and consumes the good. If a private purchase a specific good, then the chance cost of that purchase is the forgone goods the buyer could have bought instead. We develop a model during which we map or graphically derive consumer preferences. These are measured in terms of the extent of satisfaction the buyer obtains from consuming various combinations or bundles of products. The consumer's objective is to settle on the bundle of products which provides the best level of satisfaction as they the buyer define it. But consumers are considerably constrained in their choices. These constraints are defined by the consumer's income, and therefore the prices the buyer pays for the products

THE THEORY OF THE CONSUMER

Consumer make decisions by allocating their scarce income across all possible goods so as to obtain the best satisfaction. Formally, we are saying that buyers maximize their utility subject to budget constraint. Utility is defined because the satisfaction that a consumer derives from the consumption of an honest. As noted above, utility's determinants are decided by a number of noneconomic factors. Consumer value is measured in terms of the relative utilities between goods. These reflect the consumer's preferences.

While individual consumers might not give much thought to why they like one product over another, for businesses and marketers who make a living supported consumer demand, it's just about a science. Additionally, to a product's price and its availability, knowing consumer preferences can predict how likely a product is to sell and the way much it is often sold for. Preferences vary from one product to a different and therefore the components of these products can each affect preference.

Because consumer preference determines what products people will buy within their budget, understanding consumer preference will offer you a sign of consumer demand. This information will help to make sure that you simply have enough product to satisfy demand and can assist you determine the worth for your product.

If your products are like costlier brands, you'll be ready to sell them at a better profit. On the opposite hand, if your competitors offer similar dresses for fewer money that also are preferable to yours, you'll got to reduce production, change the planning or reduce your profit to make sure you are not left with an excessive amount of inventory at the top of the season.

As the preference for one product over another increase, one product may outsell the opposite albeit the worth is far higher. However, when the preference is negligible, then price and availability become the determining factors over which one will sell better.

. To determine what consumers, prefer, you've got to offer them similar products to match. When offering them two or more products to compete, each product should be complete. Asking them to match apples to oranges is fair, but asking them if they might rather have six apples or two oranges isn't. One preference that doesn't change when evaluating commodities is that buyers always prefer more to less. As well, if consumers prefer product A over product B, and that they prefer product C to product A, then it's always safe to assume they like product C over product B, too.

A common way to understand is to determine consumer preferences is to make a consumer panel. a corporation may do that itself or by hiring a marketing research organization. The panel is usually selected supported the demographics you hope your product will appeal to. There are four alternative ways to work out preferences with a consumer panel.

Preference Tests

Preference testing is beneficial once you want to match one product to a different product. The consumers are given two or more products and asked which they like. Once their preferences, or lack of preference, are recorded, you'll then analyze the results to work out which product is preferred. you can't, however, determine what proportion each product was liked using this method.

Acceptance Tests

Acceptance testing can determine what proportion a product is liked. rather than stating

which product is preferred compared to others, the consumers are asked to offer a score to every product supported their like or dislike for it. This test is additionally called hedonic ranking. Usually, the rating system is predicated on a nine-point scale, starting from extreme wish to extreme dislike, with neither dislike or like within the middle. counting on the products being evaluated, you'll invite different scores for various properties, like physical appearance, color or other attributes.

Ranking Tests

A third way of determining consumer preferences is to use a ranking test. Ranking tests are usually best for comparing consumer preference between three or more products, which the panel ranks consistent with their preference. A ranking test doesn't reveal what proportion more consumers like one product over another.

Difference Tests

As its name suggests, difference testing measures how well consumers can tell the difference between two products. for instance, if your company has developed a replacement soda, you'll ask consumers to match it to a previous version you sold, also on similar competitors' sodas, for aspects like sweetness. While this test itself doesn't reveal preferences, it can provide insight into products when used with any of the opposite tests.

Anyone selling consumer products must remember of the demand for those products and the way consumer preference affects that demand. Small business owners seldom have the budget to conduct thorough study panels, but there are other ways to work out consumer preference in your market. Subscribing to trade publications and creating news alerts for trends in your market online can assist you leverage the studies that are conducted by larger organizations at no cost to you.

The most direct thanks to determine consumer preferences is to concentrate to your current customers. Consider each online review, each email and every complaint as a kind of case study of your target market. If you sell blue handbags and you get feedback from numerous customers asking if you've got an equivalent item in red, this might be a sign that a lot of others would like red handbags also. If you've got developed an email list of your customers and prospects, it's going to be worthwhile to solicit their opinion on the colors you'll offer them. As well, online surveys are a cheap thanks to determine preferences.

Suppose you've got asked your customers directly and received survey responses from visitors to your website asking them about six different colors for an equivalent handbag, and you identify

that these consumers prefer red handbags to blue at a ratio of two-to-one. This survey has given you the info to justify adding the new color choice to your line of products.

In addition to the present, you ought to also examine how other preferences can affect your business. for instance, consumers always prefer faster delivery over slower delivery times, also as free shipping over extra shipping fees. If you are not during a position to supply free, next-day delivery, perhaps you'll offer an option to your customers: free delivery in one week, or next-day delivery for a further \$5 charge.

Finally, the trend in consumer preference for customized sizes in clothing could also be something you'll transfer to your business by offering choices in handbag sizes, or by offering customized initials sewn into the handbags. By understanding changes in consumer preferences as they happen, you'll meet changes in demand as they start to happen, instead of waiting to ascertain how larger companies are changing their products and following their lead after-the-fact.

Marketers got to know what are consumers likes and dislikes. In simple explanation, these likes and dislikes or we will say favorable or unfavorable attitudes. Attitudes also can be defined as “learned predispositions to respond to an object or class of objects in a consistently favorable or unfavorable way”.

Attitudes help us understanding, why consumers do or don't buy a specific product or shop from a particular store etc. they're used for judging the effectiveness of selling activities, for evaluating marketing actions ever before they're implemented within the market place.

This means attitudes towards brands are consumers learned tendencies to evaluate brands during a consistently favorable or unfavorable way. More formally, an overall evaluation done by consumers for selecting a specific product.

Consumers attitude always have some kinds of concepts, consumers have attitudes towards various social and physical objects including models, products, stores, brands, and other people. Consumers even have attitudes towards imaginary objects like concepts and concepts, beside their own behaviors or actions including their future behavior and past actions. Attitude formation helps buyers to form choices by providing how to assess their alternatives which supported the attributes and benefits of every product. This thesis concentrates on intention of female student towards fashion clothes purchasing, as attitude have significant influence on consumer intention, and it becomes important to know attitude theory intimately. However, attitude generally represents the effect of past personal experiences and therefore the communicated experiences of others. Attitudes are functionally useful in directing consumers towards product or brand they find useful in satisfying needs and needs. during this way customer behave to prefer the ultimate product which best satisfy their demands and

expectations. Attitude consists of three major components which are well described by tri-component attitude model, consistent with this model attitude contains three components: cognitive, affective and behavioral.

The cognitive component captures a consumer's knowledge and perceptions about products and makes. The knowledge often may be a belief about an object's attributes and benefits. The affective component may be a products evaluation in terms of rating its favorableness. The cognitive component of an attitude consists of a consumer's beliefs and knowledge about an attitude object.

in contrast, the affective component focuses are on consumer's emotions or feelings regarding a selected product or brand during a particular context. as an example, if a consumer says 'I like it', or 'it may be a terrible drink' which is expressing the results of an affective evaluation of the merchandise without cognitive information about the merchandise.

Finally, the behavioral component cares with the likelihood or tendency that a consumer will act during a specific way regarding a product. In marketing and consumer behavior, the behavioral component is usually measured in terms of consumer's intention to shop for. for instance, decisions to shop for or not buy, recommend it or other brand to friends are all behavioral component of attitudes about the merchandise.

Attitude-Behavior relationship is vital to managers because it not only concludes a consumer's evaluation of a brand or a corporation, but also represents positive or negative feelings and behavioral tendencies theoretically. the connection between attitude and behavior are often suffering from many factors like advertising and promotion. they will reinforce existing favorable attitudes or change negative attitudes. Usually, the attitude of consumers to a replacement product are often influenced by an advertising messages or the assessment of the merchandise appearing within the advertisement.

Incorporating the 'voice of the consumer' in early stages of the new development process has been identified as a critical success factor for brand spanking new development. Yet, this step is usually ignored or poorly executed. this might flow from to lack of familiarity on which methods are available, the utilization of disciplinary terminology, and difficulty in accessibility of papers on this subject. This paper reviews and categorizes 10 of the foremost common methods during this area, in terms of what their key features are, and what strengths, weaknesses and appropriateness are. We develop a classification scheme supported three performance dimensions with specific criteria: (1) stimuli used as cue for need elicitation, (2) task format, and (3) need actionability. we offer guidelines for the appropriateness of those methods within the new development process supported the novelty strategy of the event process (radical versus incremental innovation) and identify which functional department (marketing versus R&D) the tactic should primarily support.

There is general agreement that consumer behavior refers first and foremost to the act of shopping for a certain product or service. This however, is by no means the sole behavior of interest to consumer psychologists. In dispute also are search of data relevant to a sale decision, selection of retail outlet or service provider, and other actions performed before, and within the service of, a purchase. Consider, for instance, the act of subscription to a particular service, before the acquisition, consumers may look for relevant information on the online, consult friends and coworkers, read consumer magazines, and discuss the choices with a spouse or partner. The information obtained may narrow the choice to a preferred subscriber for the consumer. Then the consumer finalizes and chooses according to his thoughts and desirable for the amount he is paying and finally choose his subscription.

Consumer psychology cares with all aspects of the consumer's purchase decision, but in any given investigation we must, for practical reasons, limit our focus. we'll usually select a behavior of particular interest and examine the determinants of the behavior in question. Although not always clearly recognized, every behavior involves a choice, even if the choice is taking no action and thus maintaining the established order. Nevertheless, it is useful to differentiate between behaviors that specialize in one option and behaviors that involve a choice among two or more distinct alternatives.

Consumer behavior is that the study of consumers and therefore the processes they use to settle on, use (consume), and eliminate products and services, including consumers' emotional, mental, and behavioral responses. Consumer behavior incorporates ideas from several sciences including psychology, biology, chemistry, and economics.

Why is consumer behavior important?

Studying consumer behavior is vital because this manner marketers can understand what influences consumers' buying decisions. By understanding how consumers choose a product they will fill within the gap within the market and identify the products that are needed and therefore the products that are obsolete. Studying consumer behavior also helps marketers decide the way to present their products during a way that generates maximum impact on consumers. Understanding consumer buying behavior is that the key secret to reaching and interesting your clients, and convert them to get from you.

A consumer behavior analysis should reveal:

What consumers think and the way they feel about various alternatives (brands, products, etc.);

What influences consumers to settle on between various options;

Consumers' behavior while researching and shopping;

How consumers' environment (friends, family, media, etc.) influences their behavior.

Consumer behavior is usually influenced by various factors. Marketers should study consumer purchase patterns and find out buyer trends. In most cases, brands influence consumer behavior only with the items they will control; like how IKEA seems to compel you to spend quite what you intended to each time you walk into the shop.

So, what are the factors that influence consumers to mention yes? There are three categories of things that influence consumer behavior:

1. Personal factors: an individual's interests and opinions which will be influenced by demographics (age, gender, culture, etc.).
2. Psychological factors: an individual's response to a marketing message will depend upon their perceptions and attitudes.
3. Social factors: family, friends, education level, social media, income, all of them influence consumers' behavior.

Types of consumer behavior

There are four main sorts of consumer behavior:

1. Complex buying behavior

This type of behavior is encountered when consumers are buying an upscale, infrequently bought product. They're highly involved within the purchase process and consumers' research before committing to take a position. Imagine buying a house or a car; these are an example of a posh buying behavior.

2. Dissonance-reducing buying behavior

The consumer is very involved within the purchase process but has difficulties determining the differences between brands. 'Dissonance' can occur when the buyer worries that they're going to regret their choice.

Imagine you're buying a lawnmower. you'll choose one supported price and convenience, but after the acquisition you'll seek confirmation that you've made the proper choice.

3. Habitual buying behavior

Habitual purchases are characterized by the very fact that the buyer has little or no involvement within the product or brand category. Imagine grocery shopping: you attend the shop and buy your preferred sort of bread. you're exhibiting a habitual pattern, not strong brand loyalty.

4. Variety seeking behavior

In this situation, a consumer purchases a special product not because they weren't satisfied with the previous one, but because they seek variety. Like once you try out new shower gel scents.

What affects consumer behavior?

Many things can affect consumer behavior, but the foremost frequent factors influencing consumer behavior are:

1. Marketing campaigns

Marketing campaigns influence purchasing decisions tons. If done right and frequently, with the proper marketing message, they will even persuade consumers to vary brands or choose costlier alternatives. Marketing campaigns can even be used as reminders for products/services that require to be bought regularly but aren't necessarily on customers' top of mind (like insurance for instance). an honest marketing message can influence impulse purchases.

2. Economic conditions

For expensive products especially (like houses or cars) economic conditions play an enormous part. A positive economic environment is understood to form consumers more confident and willing to enjoys purchases regardless of their personal financial liabilities. Consumers make decisions during a longer period of time for expensive purchases and therefore the buying process are often influenced by more personal factors at an equivalent time.

3. Personal preferences

Consumer behavior also can be influenced by personal factors, likes, dislikes, priorities, morals, and values. In industries like fashion or food personal opinions are especially powerful. Advertisement can, of course, help but at the top of the day consumers' choices are greatly influenced by their preferences. If you're vegan, it doesn't matter what percentage burger joint ads you see, you're probably not going to start eating meat due to that.

4. Group influence

Peer pressure also influences consumer behavior. What our relations, classmates, immediate relatives, neighbors, and acquaintances think or do can play a big role in our decisions. psychology impacts consumer behavior. Choosing nutriment over home-cooked meals, for example, is simply one among such situations. Education levels and social factors can have an impression.

5. Purchasing power

Last but not least, our purchasing power plays a big role in influencing our behavior. Unless you're a billionaire, you'll take your budget into consideration before making a sale decision. the merchandise could also be excellent, the marketing might be on point, but if you don't have the cash for it, you won't pip out. Segmenting consumers supported their buying capacity will help marketers determine eligible consumers and achieve better results.

Customer behavior patterns

Buying behavior patterns aren't synonymous with buying habits. Habits are developed as tendencies towards an action and that they become spontaneous over time, while patterns show a predictable mental design. Each customer has his unique buying habits, while buying behavior patterns are collective and offer marketers a singular characterization. Customer behavior patterns are often grouped into:

1. Place of purchase

Most of the time customers will divide their purchases in several stores albeit all items are available within the same store. consider your favorite hypermarket: although you'll find clothes and shoes there also, you're probably buying those from actual clothing brands.

When a customer has the potential and therefore the access to get an equivalent product in several stores, they're not permanently loyal to any store, unless that's the sole store they need

access to. Studying customer behavior in terms of choice of place will help marketers identify key store locations.

2. Items purchased

Things to consider: the things that were purchased and the way much of every item was purchased. Necessity items are often bought in bulk while luxury items are more likely to be purchased less frequently and in small quantities. the quantity of every item purchased is influenced by the perishability of the item, the purchasing power of the customer, unit of sale, price, number of consumers for whom the item is meant, etc. Analyzing a handcart can give marketers many consumer insights.

3. Time and frequency of purchase

Customers will be shopping consistent with their feasibility and can expect service even during the oddest hours; especially now within the era of e-commerce where everything is merely a couple of clicks away. It's the shop's responsibility to satisfy these demands by identifying a sale pattern and match its service consistent with the time and frequency of purchases. One thing to stay in mind: differences due to the season and regional differences must even be accounted for.

4. Method of purchase

A customer can either walk into a store and buy an item right then and there, or order online and pay online via Mastercard or on delivery. the tactic of purchase also can induce more spending from the customer (for online shopping, you would possibly even be charged a shipping fee for example). The way a customer chooses to get an item also says tons about the sort of customer he's.

Customer behavior segmentation

Only 33% of the businesses that use customer segmentation say they find it significantly impactful. Customer segmentation, sorts of buyers, has always been important, but now that personalization and customer experience are factors that determine a business' success, effective segmentation is even more important.

Traditionally, most marketers use six primary sorts of behavioral segmentation.

1. Benefits sought

A customer who buys toothpaste can search for four different reasons: whitening, sensitive teeth, flavor, or price.

When customers research a product or service, their behavior can reveal valuable insights into which benefits, features, values, use cases, or problems are the foremost important motivating factors influencing their purchase decision. When a customer places a way higher value on one or more benefits over the others, these primary benefits sought are the defining motivating factors driving the acquisition decision for that customer.

2. Occasion or timing-based

Occasion and timing-based behavioral segments ask both universal and private occasions.

Universal occasions apply to the bulk of consumers or audience. for instance, holidays and seasonal events when consumers are more likely to form certain purchases.

Recurring-personal occasions are purchasing patterns for a private customer that consistently repeat over a period of your time. for instance, birthdays, anniversaries or vacations, monthly purchases, or maybe daily rituals like stopping for a cup of coffee on the thanks to work every morning.

Rare-personal occasions also are associated with individual customers, but are more irregular and spontaneous, and thus harder to predict. for instance, attending a friend's wedding.

3. Usage rate

Product or service usage is another common thanks to segment customers by behavior, supported the frequency at which a customer purchases from or interacts with a product or service. Usage behavior are often a robust predictive indicator of loyalty or churn and, therefore, lifetime value.

4. Brand loyalty status

Loyal customers are a business' most precious assets. they're cheaper to retain, usually have the very best lifetime value, and may become brand advocates. By analyzing behavioral data, customers are often segmented by their level of loyalty so marketers can understand their needs and confirm they're satisfying them. Loyal customers are those who should receive special treatment and privileges like exclusive rewards programs to nurture and strengthen the customer relationship and incentivize continued future business.

5. User status

There are many various possible user statuses you would possibly have counting on your business. a couple of examples are:

Non-users

Prospects

First-time buyers

Regular users

Defectors (ex-customers who have switched to a competitor).

6. Customer journey stage

Segmenting the audience base on buyer readiness allows marketers to align communications and personalize experiences to extend conversion at every stage. Moreover, it helps them discover stages where customers aren't progressing in order that they can identify the most important obstacles and opportunities for improvement, even on post purchase behaviors

The coronavirus pandemic has been good business for Netflix: the video streaming service has added quite 15 million new subscribers thus far this year. From an investing perspective, Netflix always surprises. Either the company's quarterly results end up to disappoint or amaze — rarely do they stay within expectations.

Netflix stocks have soared since the start of the pandemic as people practicing self-isolation have turned to their TVs for comfort, but fell when the newest results were announced because the expansion didn't fully meet expectations. Will the company's economic performance continue within the post-pandemic age?

Netflix pioneered the subscription-based video streaming business model. For a hard and fast monthly fee, subscribers get a virtual smorgasbord of content — Hollywood, Bollywood, Nollywood and dozens of Netflix's own productions.

Subscribers can search particular movies or simply flick through individually tailored recommendations supported their prior viewing habits. Having such a various choice of shows could also be good for viewers, but it's not economically efficient from a business perspective.

A less efficient service

The subscription model requires Netflix to shop for and produce a good range of flicks and television series, many of which can be of no interest to a majority of viewers. The larger the range of flicks, the less efficient the service.

In contrast, pay-by-view models provided by companies like Apple through its iTunes store require customers to form a transparent decision about whether or not they want to ascertain the movie before renting or purchasing it. More popular movies could also be costlier, less popular movies might be free or viewed for a little fee. This model is efficient for viewers: you simply buy what you consume and your choices are likely to be better informed.

Both business models have pros and cons. Many viewers enjoy consuming a spread of flicks from everywhere the planet, often on an ad-hoc basis. this type of explorative viewing is inspired by subscription-based models and fewer likely once you pay by view.

However, when rival models co-exist during a competitive industry, the more efficient business models tend to win. The market fails first on the assembly side. When production companies attempt to acquire financing for brand spanking new ventures, financiers are more interested in movies or TV shows that are almost like what's currently popular. As a result, current genres are going to be strengthened while diversity loses.

Must appeal to niche audiences

This is less of a problem for subscription-based services that require to satisfy viewers with diverse tastes and preferences. this is often the planet of Netflix. It's a sophisticated world because Netflix must have shown that appeal to wide audiences, but it must also offer a variety of niche programs.

Netflix has about 167 million viewers, and an outsized portion of the new subscribers this year have come from viewers outside of North America. Building a worldwide audience may be a crucial factor for Netflix to stay successful. Different regions have different preferences, so internationalization is a plus for Netflix due to its diverse choice of content.

This diversity aspect changes the sport between subscription-based models and pay-by-view models. What could also be a distinct segment movie in one region of the planet could also be mainstream in another.

Pay-by-view models are unlikely to create such a various portfolio, so production companies should be encouraged to distribute their work via Netflix. for instance, the TV series Designated

Survivor was cancelled after two seasons on ABC. Netflix picked it up for a 3rd season then offered viewers a Korean version of the show.

It's difficult to mention whether Netflix will find yourself being the quality of TV expecting generations to return. this may mainly depend upon how good they're in fighting the competition in several markets with better productions.

HBO Max, a replacement subscription-based streaming service which will offer access to the various great HBO shows from the past also as new content, is launching within the us in May. It joins a crowded market of Netflix competitors like Amazon Prime, Disney+ and Apple TV+. to stay before the competition, Netflix has burned through billions of dollars and has seen its long-term debt quadruple since 2015.

While we don't know whether Netflix will win the sport, the TV world is probably going to stay more diverse and affordable for viewers

As the coronavirus pandemic and its quarantines hit round the world the past few months, people were making purchases they thought essential. Among them, apparently, was the "Tiger King" streaming service: Netflix saw a record 15.8 million accounts added between January and March.

The number, which Netflix provided in its quarterly income statement Tuesday, is double what most Wall Street analysts expected for the amount and is far and away the most important quarterly add since Netflix became a mature business several years ago. It suggests that folk's stuck reception thanks to coronavirus fears are signing up for the service at a record rate.

In January, before the virus had spread worldwide, Netflix predicted the addition of about seven million new global subscribers for the three-month period.

"We're acutely aware that we are fortunate to possess a service that's even more meaningful to people confined reception, and which we will operate remotely with minimal disruption within the short to medium term. Like other home entertainment services, we're seeing temporarily higher viewing and increased membership growth," the corporate said in an investor letter.

The previous high for global additions was 9.6 million, which Netflix boasted within the comparable quarter a year ago.

The numbers validate Netflix's investor optimism. When the coronavirus pandemic began to spread within the U.S. in mid-March, Netflix's stock price sat at \$299, its lowest since December. within the month since, the share price has rocketed up 46 percent, hitting an all-time high last week of \$438.

About 2.3 million of its quarterly additions were within the U.S. and Canada. That number is quite double what the trend has been in recent quarters, where the countries often tallied but a million in net add. Netflix now has 183 million subscribers worldwide, with quite 60 million within the U.S.

Chapter 3

RESEARCH METHODOLOGY

Chapter 3 RESEARCH METHODOLOGY

Research is an integral a part of every small and large business. it's important for a corporation to seem into new areas and find new ways to expand their business. Research are often defined as a scientific approach to review new fields, new material, or to seem for brand spanking new dimensions in an existing field.

Research methods and research methodology are the 2 terms related to research which are confused by many of us.

The research method is research methods are wont to define the subject of the research and to determine a deeper understanding about it whereas, research methodology may be a systematic approach to gather and evaluate data within the research process.

Let us study both these terms intimately and also find out how these terms are different from one another.

What is research methodology

The research methodology is mentioned the study of methods and to determine an understanding of why these methods were used for the research. Research methodology provides a logical explanation behind the steps taken within the research.

Research methodology explains the means using which ends up were obtained within the research.

Research methodology provides guidance for the research process. the most objectives of research methodologies are concerned with the subsequent aspects:

Suitable research methods for the research problem.

Determine the accuracy of the result of opted research methods.

And, finally, to form sure that research methods are efficient enough.

A well-defined methodology gives an evidence why a specific research methodological approach is employed for the research, in what order and the way research methods were applied to urge

the results of the research, what were the info collection methods, and explain the info analysis and procedures thoroughly.

Research method

The research method consists of all the techniques and method which are employed by a researcher during a research process to seek out the answer to the research problem. the only purpose of research methods is to seek out the answer.

Research methods are often of two types qualitative research methods and quantitative research methods.

Qualitative research methods

The qualitative research method consists of open-ended and conversational research methods. The qualitative research method is employed to gather in-depth and detailed data about the research topic.

Qualitative research methods are designed in such how that reveals about the behavior and perception of individuals under research.

Data collected from qualitative research methods are descriptive. Therefore, it's easy to draw inferences from it. Qualitative research methods are widely utilized in the social and behavioral sciences.

Methods sort of a focus group, one-on-one interviews, case study research, ethnographic research, observation research, and record-keeping are the varied methods utilized in qualitative research. [Click here](#) to find out about the various methods utilized in qualitative research intimately.

Quantitative research methods

Quantitative research methods are those methods where a scientific approach is employed to gather quantifiable of knowledge by performing computational, mathematical, or statistical techniques. the info collected through quantitative research methods are usually in numerical form.

The proper outcome is often deduced by analyzing the info during a systematic form. The results obtained through quantitative research methods are statistical, logical, and unbiased.

These research methods are applied to a gaggle of the population, which represents the whole population.

Methods like survey research, cross-sectional surveys, longitudinal surveys, correlational research, causal-comparative research, experimental research, are primary data collection methods in quantitative research methods whereas the info collected from methods like educational institutions, public libraries, data available on internet, government and non-government resources, and commercial information resources, etc. are the secondary data collection methods in quantitative research methods. [Click here to find out more about quantitative research methods.](#)

Types of Research Methods consistent with the aim of the Study

According to the aim of the study, sorts of research methods are often divided into two categories: applied research and fundamental research. Applied research is additionally mentioned as an action research, and therefore the fundamental research is usually called basic or pure research. The table below summarizes the most differences between applied research and fundamental research. Similarities between applied and fundamental (basic) research relate to the adoption of a scientific and scientific procedure to conduct the study.

Applied research

Applied research “aims at finding an answer for an instantaneous problem facing a society, or an industrial/business organization, whereas fundamental research is especially concerned with generalizations and with the formulation of a theory”. Applied research is taken into account to be non-systematic inquiry and it's usually launched by a corporation, agency or a private so as to deal with a selected problem.

Fundamental research

Fundamental research, also referred to as basic research or pure research doesn't usually generate findings that have immediate applications during a practical level. Fundamental research is driven by curiosity and therefore the desire to expand knowledge in specific research area. this sort of research makes a selected contribution to the tutorial body of data within the research area.

Fundamental studies tend to form generalizations about the phenomenon, and therefore the philosophy of this sort of studies are often explained as ‘gathering knowledge for the sake of knowledge’. Fundamental researches mainly aim to answer the questions of why, what or how and that they tend to contribute the pool of fundamental knowledge within the research area.

Types of Research Methods consistent with Research Design

On the idea of research design the kinds of research methods are often divided into two groups – exploratory and conclusive. Exploratory studies only aim to explore the research area and that they don't plan to offer final and conclusive answers to research questions. Conclusive studies, on the contrary, aim to supply final and conclusive answers to research questions.

Exploratory research

Exploratory research, because the name implies, intends merely to explore the research questions and doesn't shall offer final and conclusive solutions to existing problems. this sort of research is typically conducted to review a drag that has not been clearly defined yet.

Conducted so as to work out the character of the matter, exploratory research isn't intended to supply conclusive evidence, but helps us to possess a far better understanding of the matter. When conducting exploratory research, the researcher needs to be willing to vary his/her direction as a result of revelation of latest data and new insights.

Exploratory research design doesn't aim to supply the ultimate and conclusive answers to the research questions, but merely explores the research topic with varying levels of depth. it's been noted that “exploratory research is that the initial research, which forms the idea of more conclusive research. It can even help in determining the research design, sampling methodology and data collection method” Exploratory research “tends to tackle new problems on which little or no previous research has been done”. Unstructured interviews are the foremost popular primary data collection method with exploratory studies.

Conclusive research

Conclusive research design, because the name implies, is applied to get findings that are practically useful in reaching conclusions or decision-making. during this sort of studies research objectives and data requirements got to be clearly defined. Findings of conclusive studies usually have specific uses. Conclusive research design provides how to verify and quantify findings of exploratory studies.

Conclusive research design usually involves the appliance of quantitative methods of knowledge collection and data analysis. Moreover, conclusive studies tend to be deductive in nature and research objectives in these sorts of studies are achieved via testing hypotheses.

Hypotheses

A hypothesis may be a specific statement of prediction. It describes in concrete (rather than theoretical) terms what you expect will happen in your study. Not all studies have hypotheses. Sometimes a study is meant to be exploratory (see inductive research). there's no formal hypothesis, and maybe the aim of the study is to explore some area more thoroughly so as to develop some specific hypothesis or prediction which will be tested in future research. one study may have one or many hypotheses.

Actually, whenever I mention a hypothesis, I'm really thinking simultaneously about two hypotheses. Let's say that you simply predict that there'll be a relationship between two variables in your study. The way we might formally found out the hypothesis test is to formulate two hypothesis statements, one that describes your prediction and one that describes all the opposite possible outcomes with reference to the hypothesized relationship. Your prediction is that variable A and variable B are going to be related (you don't care whether it's a positive or negative relationship). Then the sole other possible outcome would be that variable A and variable B aren't related. Usually, we call the hypothesis that you simply support (your prediction) the choice hypothesis, and that we call the hypothesis that describes the remaining possible outcomes the null hypothesis. Sometimes we use a notation like H_A or H_1 to represent the choice hypothesis or your prediction, and H_0 or H_0 to represent the null case. you've got to take care here, though. In some studies, your prediction might alright be that there'll be no difference or change. during this case, you're essentially trying to seek out support for the null hypothesis and you're against the choice.

If your prediction specifies a direction, and therefore the reform the null therefore is that the no difference prediction and the prediction of the other direction, we call this a one-tailed hypothesis.

Variables

You won't be ready to do considerably in research unless you recognize the way to mention variables. A variable is any entity which will combat different values. OK, so what does that mean? Anything which will vary are often considered a variable. as an example, age is often considered a variable because age can take different values for various people or for an equivalent person at different times. Similarly, country is often considered a variable because a person's country is often assigned a worth.

Variables aren't always 'quantitative' or numerical. The variable city consists of text values like Network or Sydney. We can, if it's useful, assign quantitative values rather than (or in situ of) the text values, but we don't need to assign numbers so as for something to be a variable. It's also important to understand that variables aren't only things that we measure within the traditional sense. as an example, in much social research and in program evaluation, we consider the treatment or program to be made from one or more variables (i.e., the cause' are often considered a variable). an academic program can have varying amounts of 'time on task', 'classroom settings', 'student-teacher ratios', and so on. So even the program is often considered a variable (which are often made from variety of sub-variables).

An attribute may be a specific value on a variable. as an example, the variable sex or gender has two attributes: male and feminine. Or, the variable agreement could be defined as having five attributes:

1 = strongly disagree

2 = disagree

3 = neutral

4 = agree

5 = strongly agree

Another important distinction having to try to to with the term 'variable' is that the distinction between an independent and variable. the experimental variable is what you (or nature) manipulates – a treatment or program or cause. The variable is what's suffering from the experimental variable – your effects or outcomes. for instance, if you're studying the consequences of a replacement program on student achievement, the program is that the experimental variable and your measures of accomplishment are the dependent ones.

Time in Research

Time is a crucial element of any research design, and here I would like to introduce one among the foremost fundamental distinctions in research design nomenclature: cross-sectional versus longitudinal studies. A cross-sectional study is one that takes place at one point in time. In effect, we are taking a 'slice' or cross-section of whatever it's we're observing or measuring. A longitudinal study is one that takes place over time – we've a minimum of two (and often more) waves of measurement during a longitudinal design.

A further distinction is formed between two sorts of longitudinal designs: repeated measures and statistic. there's no universally prescribed rule for distinguishing these two terms, but generally, if you've got two or a couple of waves of measurement, you're employing a repeated measures design. If you've got many waves of measurement over time, you've got a statistic. what percentage is 'many'? Usually, we wouldn't use the term statistic unless we had a minimum of twenty waves of measurement, and sometimes much more. Sometimes the way we distinguish these is with the analysis methods we might use. statistical analysis requires that you simply have a minimum of twenty approximately observations. Repeated measures analyses aren't often used with as many as twenty waves of measurement.

Types of Research Questions

There are three basic sorts of questions that research projects can address:

Descriptive. When a study is meant primarily to explain what's happening or what exists. popular opinion polls that seek only to explain the proportion of individuals who hold various opinions are primarily descriptive in nature. as an example, if we would like to understand what percent of the population would vote for a Democratic or a Republican within the next presidential election, we are simply curious about describing something.

Relational. When a study is meant to seem at the relationships between two or more variables. A popular opinion poll that compares what proportion of males and females say they might vote for a Democratic or a Republican candidate within the next presidential election is actually studying the connection between gender and voting preference.

Causal. When a study is meant to work out whether one or more variables (e.g., a program or treatment variable) causes or affects one or more outcome variables. If we did a popular opinion poll to undertake to work out whether a recent political ad campaign changed voter preferences, we might essentially be studying whether the campaign (cause) changed the proportion of voters who would vote Democratic or Republican (effect).

The three question types are often viewed as cumulative. That is, a relational study assumes that you simply can first describe (by measuring or observing) each of the variables you're trying to relate. And, a causal study assumes that you simply can describe both the cause and effect variables which you'll show that they're associated with one another. Causal studies are probably the foremost demanding of the three.

Sampling:

Sampling is defined because the process of choosing certain members or a subset of the population to form statistical inferences from them and to estimate characteristics of the entire population. Sampling is widely employed by researchers in marketing research in order that they

are doing not got to research the whole population to gather actionable insights. it's also a time-convenient and an economical method and hence forms the idea of any research design.

For example, if a drug manufacturer would really like to research the adverse side effects of a drug on the population of the country, it's on the brink of impossible to be ready to conduct a search study that involves everyone. during this case, the researcher decides a sample of individuals from each demographic then conducts the research on them which provides them an indicative feedback on the behavior of the drug on the population.

Types of Sampling: Sampling Methods

Any marketing research study requires two essential sorts of sampling. They are:

Probability Sampling: Probability sampling is a sampling method that selects random members of a population by setting a couple of selection criteria. These selection parameters allow every member to possess the equal opportunities to be a neighborhood of varied samples.

Non-probability Sampling: Non probability sampling method is reliant on a researcher's ability to pick members randomly. This sampling method isn't a hard and fast or pre-defined selection process which makes it difficult for all elements of a population to possess equal opportunities to be included during a sample.

In this blog, we discuss the varied probability and non-probability sampling methods which will be implemented in any marketing research study.

Types of Sampling: Probability Sampling Methods

Probability Sampling may be a sampling technique during which sample from a bigger population are chosen employing a method supported the idea of probability. This sampling method considers every member of the population and forms samples on the idea of a hard and fast process. for instance, during a population of 1000 members, each of those members will have 1/1000 chances of being selected to be a neighborhood of a sample. It gets obviate bias within the population and provides a good chance to all or any members to be included within the sample.

There are 4 sorts of probability sampling technique:

Simple Random Sampling: one among the simplest probability sampling techniques that helps in saving time and resources, is that the Simple sampling method. it's a trustworthy method of obtaining information where every single member of a population is chosen randomly, merely accidentally and every individual has the precise same probability of being chosen to be a neighborhood of a sample.

For example, in a corporation of 500 employees, if the HR team decides on conducting team building activities, it's highly likely that they might prefer picking chits out of a bowl. during this case, each of the five hundred employees has a civil right of being selected.

Cluster Sampling: Cluster sampling may be a method where the researchers divide the whole population into sections or clusters that represent a population. Clusters are identified and included during a sample on the idea of defining demographic parameters like age, location, sex etc. which makes it extremely easy for a survey creator to derive effective inference from the feedback.

For example, if the govt of the us wishes to gauge the amount of immigrants living within the Mainland US, they will divide it into clusters on the idea of states like California, Texas, Florida, Massachusetts, Colorado, Hawaii etc. this manner of conducting a survey are going to be simpler because the results are going to be organized into states and provides insightful immigration data.

Systematic Sampling: Using systematic sampling method, members of a sample are chosen at regular intervals of a population. It requires selection of a start line for the sample and sample size which will be repeated at regular intervals. this sort of sampling method features a predefined interval and hence this sampling technique is that the least time-consuming.

For example, a researcher intends to gather a scientific sample of 500 people during a population of 5000. Each element of the population is going to be numbered from 1-5000 and each 10th individual is going to be chosen to be a neighborhood of the sample (Total population/ Sample Size = $5000/500 = 10$).

Stratified Random Sampling: Stratified sampling may be a method where the population are often divided into smaller groups, that don't overlap but represent the whole population together. While sampling, these groups are often organized then draw a sample from each group separately.

For example, a researcher looking to research the characteristics of individuals belonging to different annual income divisions, will create strata (groups) consistent with annual family income like – but \$20,000, \$21,000 – \$30,000, \$31,000 to \$40,000, \$41,000 to \$50,000 etc. and

other people belonging to different income groups are often observed to draw conclusions of which income strata have which characteristics. Marketers can analyze which income groups to focus on and which of them to eliminate so as to make a roadmap that might definitely bear fruitful results.

Use of the Probability Sampling Method

There are multiple uses of the probability sampling method. They are:

Reduce Sample Bias: Using the probability sampling method, the bias within the sample derived from a population is negligible to non-existent. the choice of the sample largely depicts the understanding and therefore the inference of the researcher. Probability sampling results in higher quality data collection because the population is appropriately represented by the sample.

Diverse Population: When the population is large and diverse, it's important to possess adequate representation in order that the info isn't skewed towards one demographic. for instance, if Square would really like to know the folks that could their point-of-sale devices, a survey conducted from a sample of individuals across US from different industries and socio-economic backgrounds, helps.

Create an Accurate Sample: Probability sampling helps the researchers plan and make an accurate sample. This helps to get well-defined data.

Types of Sampling: Non-probability Sampling Methods

The non-probability method may be a sampling method that involves a set of feedback on the idea of a researcher or statistician's sample selection capabilities and not on a hard and fast selection process. In most situations, output of a survey conducted with a non-probable sample results in skewed results, which cannot totally represent the specified target population. But there are situations like the preliminary stages of research or where there are cost constraints for conducting research, where non-probability sampling is going to be far more effective than the opposite type.

There are 4 sorts of non-probability sampling which can explain the aim of this sampling method during a better manner:

Convenience sampling: This method depends on the convenience of access to subjects like surveying customers at a mall or passers-by on a busy street. it's usually termed as convenience sampling, as it's administered on the idea of how easy is it for a researcher to urge in-tuned with the themes. Researchers have nearly no authority over selecting elements of the sample and it's purely done on the idea of proximity and not representativeness. This non-probability sampling

method is employed when there are time and price limitations in collecting feedback. In situations where there are resource limitations like the initial stages of research, convenience sampling is employed.

For example, startups and NGOs usually conduct convenience sampling at a mall to distribute leaflets of upcoming events or promotion of a cause – they are doing that by standing at the doorway of the mall and giving out pamphlets randomly.

Judgmental or Purposive Sampling: In judgmental or purposive sampling, the sample is made by the discretion of the judge purely considering the aim of study alongside the understanding of audience. Also referred to as deliberate sampling, the participants are selected solely on the idea of research requirements and elements who don't suffice the aim are kept out of the sample. as an example, when researchers want to know the thought process of individuals who have an interest in studying for his or her master's degree. the choice criteria are going to be: "Are you curious about studying for Masters in ...?" and people who respond with a "No" will be excluded from the sample.

Snowball sampling: Snowball sampling may be a sampling method that's utilized in studies which require to be administered to know subjects which are difficult to trace. for instance, it'll be extremely challenging to survey shelter less people or illegal immigrants. In such cases, using the snowball theory, researchers can track a couple of of that specific category to interview and results are going to be derived thereon basis. This sampling method is implemented in situations where the subject is very sensitive and not openly discussed like conducting surveys to collect information about HIV Aids. Not many victims will readily answer the questions but researchers can contact people they could know or volunteers related to the cause to urge in-tuned with the victims and collect information.

Quota sampling: In Quota sampling, selection of members during this sampling technique happens on basis of a pre-set standard. during this case, as a sample is made on basis of specific attributes, the created sample will have an equivalent attribute that are found within the total population. it's a particularly quick method of collecting samples.

Use of the Non-Probability Sampling Method

There are multiple uses of the non-probability sampling method. They are:

Create a hypothesis: The non-probability sampling method is employed to make a hypothesis when limited to no prior information is available. This method helps with immediate return of knowledge and helps to create a base for any longer research.

Exploratory research: This sampling technique is widely used when researchers aim at conducting qualitative research, pilot studies or exploratory research.

Budget and time constraints: The non-probability method when there are budget and time constraints and a few preliminary data has got to be collected. Since the survey design isn't rigid, it's easier to select respondents randomly and have them take the survey or questionnaire.

Measurement

Measurement is that the process of observing and recording the observations that are collected as a part of a search effort. Levels of Measurement in Statistics

To perform statistical analysis of knowledge, it's important to first understand variables and what should be measured using these variables. There are different levels of measurement in statistics and data measured using them are often broadly classified into qualitative and quantitative data.

First, let's understand what a variable is. A quantity whose value changes across the population and may be measured is named variable. as an example, consider a sample of employed individuals. The variables for this set of the population are often industry, location, gender, age, skills, job-type, etc. the worth of the variables will differ with each employee.

For example, it's practically impossible to calculate the typical hourly rate of a worker within the US. So, a sample audience is randomly selected such it represents the larger population appropriately. Then the typical hourly rate of this sample audience is calculated. Using statistical tests, you'll conclude the typical hourly rate of a bigger population.

The level of measurement of a variable decides the statistical test type to be used. The mathematical nature of a variable or in other words, how a variable is measured is taken into account because the level of measurement.

What are Nominal, Ordinal, Interval and Ratio Scales?

Nominal, Ordinal, Interval, and Ratio are defined because the four fundamental levels of measurement scales that are wont to capture data within the sort of surveys and questionnaires, each being a multiple-choice question.

Each scale is an incremental level of measurement, meaning, each scale fulfills the function of the previous scale, and every one survey question scales like Likert, Semantic Differential, Dichotomous, etc., are the derivation of this these 4 fundamental levels of variable measurement. Before we discuss all four levels of measurement scales in details, with examples, let's have a fast brief check out what these scales represent.

Nominal scale may be a naming scale, where variables are simply “named” or labeled, with no specific order. Ordinal scale has all its variables during a specific order, beyond just naming them. Interval scale offers labels, order, also as, a selected interval between each of its variable options. Ratio scale bears all the characteristics of an interval scale, additionally thereto, it also can accommodate the worth of “zero” on any of its variables.

Here’s more on Nominal, Ordinal, Interval, Ratio: The four levels of measurement in research and statistics.

Nominal Scale: 1st Level of Measurement

Nominal Scale, also called the specific variable scale, is defined as a scale used for labeling variables into distinct classifications and doesn’t involve a quantitative value or order. This scale is that the simplest of the four variable measurement scales. Calculations done on these variables are going to be futile as there's no numerical value of the choices.

There are cases where this scale is employed for the aim of classification – the numbers related to variables of this scale are only tags for categorization or division. Calculations done on these numbers are going to be futile as they need no quantitative significance.

For an issue such as:

Where does one live?

1- Suburbs

2- City

3- Town

Nominal scale is usually utilized in research surveys and questionnaires where only variable labels hold significance.

For instance, a customer survey asking “Which brand of smartphones does one prefer?” Options: “Apple”- 1, “Samsung”-2, “OnePlus”-3.

In this survey question, only the names of the brands are significant for the researcher conducting marketing research. there's no need for any specific order for these brands. However, while capturing nominal data, researchers conduct analysis supported the associated labels.

In the above example, when a survey respondent selects Apple as their preferred brand, the info entered and associated are going to be “1”. This helped in quantifying and answering the ultimate question – what percentage respondents selected Apple, what percentage selected Samsung, and the way many went for OnePlus – and which one is that the highest.

This is the elemental of quantitative research, and nominal scale is that the most fundamental research scale.

Nominal Scale Data and Analysis

There are two primary ways during which nominal scale data are often collected:

By asking an open-ended question, the answers of which may be coded to a respective number of labels decided by the researcher.

The other alternative to gather nominal data is to incorporate a multiple-choice question during which the answers are going to be labeled.

In both cases, the analysis of gathered data will happen using percentages or modemed., the foremost common answer received for the question. it's possible for one question to possess quite one mode because it is feasible for 2 common favorites can exist during a target population.

Nominal Scale Examples

Gender

Political preferences

Place of residence

What is your Gender? what's your Political preference? Where does one live?

M- Male 1- Independent 1- suburbs

F- Female 2- Democratic 2- town

3- Republican 3- city

Nominal Scale

In this, you'll specify the extent of measurement as scale (numeric data on an interval or ratio scale), ordinal, or nominal. Nominal and ordinal data are often either string alphanumeric or numeric.

Upon importing the info for any variable into the SPSS input data, it takes it as a scale variable by default since the info essentially contains numeric values. It's important to vary it to either nominal or ordinal or keep it as scale counting on the variable the info represents.

Ordinal Scale: 2nd Level of Measurement

Ordinal Scale is defined as a variable measurement scale wont to simply depict the order of variables and not the difference between each of the variables. These scales are generally wont to depict non-mathematical ideas like frequency, satisfaction, happiness, a degree of pain, etc. It's quite straightforward to recollect the implementation of this scale as 'Ordinal' sounds almost like 'Order', which is strictly the aim of this scale.

Ordinal Scale maintains description qualities alongside an intrinsic order but is barren of an origin of scale and thus, the space between variables can't be calculated. Description qualities indicate tagging properties almost like the nominal scale, additionally to which, the ordinal scale also features a relative position of variables. Origin of this scale is absent thanks to which there's no fixed start or "true zero".

Ordinal Scale Examples

Status at workplace, tournament team rankings, order of product quality, and order of agreement or satisfaction are a number of the foremost common samples of the ordinal Scale. These scales are generally utilized in marketing research to collect and evaluate relative feedback about product satisfaction, changing perceptions with product upgrades, etc.

For example, a semantic differential scale question such as:

How satisfied are you with our services?

Very Unsatisfied – 1

Unsatisfied – 2

Neutral – 3

Satisfied – 4

Very Satisfied – 5

Here, the order of variables is of prime importance then is that the labeling. Very unsatisfied will always be worse than unsatisfied and satisfied are going to be worse than very satisfied.

This is where ordinal scale may be a step above nominal scale – the order has relevancy to the results then is their naming.

Analyzing results supported the order alongside the name becomes a convenient process for the researcher.

If they shall obtain more information than what they might collect employing a nominal scale, they will use the ordinal scale.

This scale not only assigns values to the variables but also measures the rank or order of the variables, such as:

Grades

Satisfaction

Happiness

How satisfied are you with our services?

1- Very Unsatisfied

2- Unsatisfied

3- Neural

4- Satisfied

5- Very Satisfied

Ordinal Data and Analysis

Ordinal scale data are often presented in tabular or graphical formats for a researcher to conduct a convenient analysis of collected data. These methods are generally implemented to match two or more ordinal groups.

Interval Scale: 3rd Level of Measurement

Interval Scale is defined as a numerical scale where the order of the variables is understood also because the difference between these variables. Variables that have familiar, constant, and computable differences are classified using the Interval scale. it's easy to recollect the first role of this scale too, 'Interval' indicates 'distance between two entities', which is what Interval scale helps in achieving.

These scales are effective as they open doors for the statistical analysis of provided data. Mean, median, or mode are often wont to calculate the central tendency during this scale. the sole drawback of this scale is that there no pre-decided start line or a real zero value.

Interval scale contains all the properties of the ordinal scale, additionally to which, it offers a calculation of the difference between variables. the most characteristic of this scale is that the equidistant difference between objects.

For instance, consider a Celsius/Fahrenheit scale –

80 degrees is usually above 50 degrees and therefore the difference between these two temperatures is that the same because the difference between 70 degrees and 40 degrees.

Also, the worth of 0 is bigoted because negative values of temperature do exist – which makes the Celsius/Fahrenheit scale a classic example of an interval scale.

Interval scale is usually chosen in research cases where the difference between variables may be a mandate – which can't be achieved employing a nominal or ordinal scale. The Interval scale quantifies the difference between two variables whereas the opposite two scales are solely capable of associating qualitative values with variables.

The mean and median values in an ordinal scale are often evaluated, unlike the previous two scales.

In statistics, interval scale is usually used as a numerical value can't only be assigned to variables but calculation on the idea of these values also can be administered.

Even if interval scales are amazing, they are doing not calculate the “true zero” value which is why subsequent scale comes into the image.

Interval Data and Analysis

All the techniques applicable to nominal and ordinal data analysis are applicable to Interval Data also. aside from those techniques, there are a couple of analysis methods like descriptive statistics, correlation multivariate analysis which is extensively for analyzing interval data.

Descriptive statistics is that the term given to the analysis of numerical data which helps to explain, depict, or summarize data during a meaningful manner and it helps in calculation of mean, median, and mode.

Interval Scale Examples

There are situations where attitude scales are considered to be interval scales.

Apart from the scale, time is additionally a really common example of an interval scale because the values are already established, constant, and measurable.

Calendar years and time also fall into this category of measurement scales.

Likert scale, Net Promoter Score, Semantic Differential Scale, Bipolar Matrix Table, etc. are the most-used interval scale examples.

The following questions fall into the Interval Scale category

What is the temperature in your city?

At a primary glance all the various scales which may seem similar and simply replaceable by one another. However, as you study them thorough, you realize the range of their natures and differences in their uses and their findings. There are over 20 differing types of scales that are employed by researchers in online surveys. they will be categorized in two classes – comparative scales and non-comparative scales.

There are variety of things you would possibly consider when choosing which scales to include during a questionnaire and which of them to use while analyzing data. a number of the factors are:

The type of knowledge that's required from the respondent – ratio, interval, ordinal or nominal.

How the knowledge is going to be used once it's acquired.

Number of divisions within the scale – odd or maybe.

Types of statistical analysis methods to be used after data is acquired.

The physical sort of the size – vertical, linear, horizontal, etc.

Details to be provided within the scale as labels.

Whether or not response to an issue is mandatory.

Since non-comparative scaling techniques are easier and simpler to know, we'll introduce to you the foremost important four scales. You'll be delighted to ascertain how easy it's to know and use them. those that already realize it them are encouraged to discuss the post and allow us to know any tips which may further help our readers in using these scales.

1. Graphic Rating Scale

A graphic rating scale, also referred to as endless rating scale usually seems like the figure drawn above. The ends of the continuum are sometimes labeled with opposite values. Respondents are required to form a mark at any point on the size that they find appropriate. Sometimes, there are numbers along the markings of the road too. At other times, there are not any markings in the least on the road.

2. Likert Scale

How satisfied are you with our service?

☐ Very Unsatisfied ☐ Unsatisfied ☐ Neutral ☒ Satisfied ☐ Very Satisfied

A Likert scale typically contains an odd number of options, usually 5 to 7. One end is labeled because the most positive end while the opposite one is labeled because the most positive one with the label of 'neutral' within the middle of the size.

The phrases 'purely negative' and 'mostly negative' could even have been 'extremely disagree' and 'slightly disagree'.

3. Semantic Differential Scale (Max Diff)

How satisfied are you with the following:

	Least	Most
Ease-of-use	☐	☐
Speed	☐	☐
Design	☐	☐
Size	☐	☐
Durability	☐	☐

A semantic differential scale may be a combination of quite one continuum. it always contains an odd number of radio buttons with labels at opposite ends. Max Diff scales are often utilized in trade-off analysis like conjoint.

Madoff analysis are often utilized in new product features research or or maybe market segmentation research to urge accurate orderings of the foremost important product features.

Discriminate among feature strengths more effectively than derived importance methodologies. Like other trade-off analyses, the analysis derives utilities for every of the foremost important product features which may be wont to derive optimal products, using market segmentation to place respondents into groups with similar preference structures, or to prioritize strategic product goals.

You can have your respondents perform Forced-choice nature of the tasks, and disentangle the relative feature importance in cases where average Likert-style ratings might all have very similar ratings.

4. Side-by-Side Matrix

Importance					Satisfaction				
Not Important			Very Important		Not Satisfied			Very Satisfied	
1	2	3	4	5	1	2	3	4	5
☐	☐	☐	☒	☐	☐	☐	☐	☐	☒
☐	☐	☐	☐	☒	☐	☐	☐	☒	☐
☐	☐	☐	☐	☒	☐	☐	☐	☒	☐

Another very commonly used scale in questionnaires is that the side-by-side matrix. a standard and powerful application of the side-by-side matrix is that the importance/satisfaction sort of question.

First, ask the respondent how important an attribute is, then ask them how satisfied they're together with your performance during this area. logic and loop functions also allow you to run through this question multiple times with other alternatives that the respondent might consider. This yields benchmark data which will allow you to match your performance against other competing alternatives.

Here is an example of knowledge from an importance/satisfaction question. The importance rating is that the line and therefore the performance ratings are the bars. With this sort of knowledge, you'll actually see where your company must increase its efforts to more closely meet the requirements of the customer.

While there are many online survey tools and online survey software to settle on from, you'll find that not all of them have these differing types of scales available to them.

As you're designing your survey, make certain to supply a spread of scales. Using different scales in your survey will engage the respondent more fully and stop them from clicking the very best, lowest or middle rating all the time. Another benefit to using different sorts of scales in your survey is that every scale provides you a singular perspective on the info that you simply are analyzing.

Before designing your survey, review the various sorts of scales and question types inside your online survey tool and make certain to select the one which will best assist you make your decision.

Chapter – 4

DATA ANALYSIS AND INTERPRETATION

DATA ANALYSIS AND INTERPRETATION

2)Gender
90 responses

In this survey, the user of Male is comparatively higher than female of a difference of 13.4%

MALE-42.2%

FEMAIL-55.6%

3)Nationality

89 responses

Maximum users are Indian in the particular survey

4)Age Groups

90 responses

In this data 60% of users age groups are between 15-20 years old

And then comes 20-30 years old with almost of 33.3%

30-40 years old are of 4.4%

40-50+ years old are 1.1%

5) Profession

90 responses

In this survey the maximum user's profession are,

- I. Students-78.9%
- II. Business-12.2%
- III. Private-6.7
- IV. Government-2.2

6) Are you an existing customer of NETFLIX

90 responses

Maximum customer of Netflix where an existing user with 82.2%

And not a user with 11.1%

7) What device/Platform do you use NETFLIX on?

90 responses

The platform they use the most

Smartphone-41.1%

Television-31.1%

Computers/laptop-21.1%

Other-6.7%

8) If you had to choose any streaming other than NETFLIX what would it be

89 responses

So, this is an important survey where it tells the competitor of Netflix

Amazon prime- 55.1%

Hotstar-12.4%

Hulu-1.1%

Netlix-39.3%

Other-1.1%

9) Rank the following features of NETFLIX on a satisfaction scale.

Satisfaction of Netflix – RANKING

1. Many Series-72
2. Quality content-68
3. Instant blue ray and Dolby atmos-47
4. Interface-44
5. Pricing-23

10) Since how long have you been using NETFLIX

89 responses

Duration of Netflix users

- 1) 1 year plus-39.3%
- 2) 3 month-25.8%
- 3) 6 month-22.5%
- 4) 1 year-12.4%

11) How often do you use NETFLIX in a day.

89 responses

The number of hours of Netflix per day

- i. 2-3 hours – 31.5%
- ii. 1-2 hours -29.2%
- iii. 3-4 and 4-5 hours -13.5%
- iv. More than 5 hours -12.4%

12) How often do you go through NETFLIX's recommendation list before you choose new content to watch?

88 responses

79.5% of the Netflix user go through the recommendation sometime before watching

12.5% of the Netflix user always go through the recommendation

8% never go through it

13) How much likely will you recommend NETFLIX to others?

89 responses

60.7% of the Netflix user will recommend to others after watching

34.8% of the Netflix user recommend it sometimes or on timely basis to others

4.5% of the Netflix user never recommend to others

14) What type of shows you prefer on NETFLIX?

88 responses

Maximum users of Netflix prefer,

Thriller – 34.1%

Sci-fic/action – 28.4%

Horror – 18.2%

15) What is the reason you prefer NETFLIX over other online streaming

89 responses

36.6% of user prefer Netflix over other online streaming because,

New content

Entertainment

Popularity

Pricing

16) What type of subscription you prefer?

89 responses

Netflix subscription,

Premium – 47.2%

Standard and Mobile – 20.2%

Basic – 12.4%

17) Overall how satisfied are you with NETFLIX

89 responses

Satisfactory level for Netflix for the user

Extremely Satisfied – 49.4%

Moderately Satisfied – 31.5%

Neutral – 18%

Moderately Dissatisfied – 1.1%

Chapter – 5

COCNLUSION

CONCLUSION

The demand changes as a result of changes in price, other factors determining it being held constant. We shall explain below intimately how these other factors determine market demand for a commodity.

These other factors determine the position or level of demand curve of a commodity.

It may be noted that when there's a change in these non-price factors, the entire curve shifts rightward or leftward because the case could also be. the subsequent factors determine market demand for a commodity.

1. Tastes and Preferences of the Consumers:

An important factor which determines the demand for an honest is that the tastes and preferences of the consumers for it. an honest that consumers' tastes and preferences are greater, its demand would be large and its demand curve will therefore lie at a better level. People's tastes and preferences for various goods often change and as a result there's change in demand for them.

The changes in demand for various goods occur thanks to the changes in fashion and also thanks to the pressure of advertisements by the manufacturers and sellers of various products. On the contrary, when certain goods leave of fashion or people's tastes and preferences not remain favorable to them, the demand for them decreases.

2. Income of the People:

The demand for goods also depends upon the incomes of the people. The greater the incomes of the people, the greater are going to be their demand for goods. In drawing the demand schedule or the demand curve for an honest we take income of the people as given and constant. When as a result of the increase within the income of the people, the demand increases, the entire of the demand curve shifts upward and the other way around.

The greater income means the greater purchasing power. Therefore, when incomes of the people increase, they will afford to shop for more. it's due to this reason that increase in income features a positive effect on the demand for an honest.

When the incomes of the people fall, they might demand less of an honest and as a result the demand curve will shift downward. as an example, as a result of economic process in India the incomes of the people have greatly increased due to the massive investment expenditure on the event schemes by the govt and therefore the private sector.

As a result of this increase in incomes, the demand permanently grains and another commodity has greatly increased. Likewise, when due to drought during a year the agriculture production greatly falls, the incomes of the farmers decline. As a result of the decline in incomes of the farmers, they're going to demand less of the cotton and other manufactured products.

3. Changes in Prices of the Related Goods:

The demand for an honest is additionally suffering from the costs of other goods, especially those which are associated with it as substitutes or complements. once we draw the demand schedule or the demand curve for an honest, we take the costs of the related goods as remaining constant.

Therefore, when the costs of the related goods, substitutes or complements, change, the entire demand curve would change its position; it'll shift upward or downward because the case could also be. When the worth of a substitute for an honest fall, the demand for that good will decline and when the worth of the substitute rises, the demand for that good will increase.

For example, when price of tea and incomes of the people remain an equivalent but the worth of coffee falls, the consumers would demand less of tea than before. Tea and occasional are very close substitutes. Therefore, when coffee becomes cheaper, the consumers substitute coffee for tea and as a result the demand for tea declines. the products which are complementary with one another, the autumn within the price of any of them would favorably affect the demand for the opposite.

For instance, if price of milk falls, the demand for sugar would even be favorably affected. When people would take more milk, the demand for sugar also will increase. Likewise, when the worth of cars falls, the number demanded of them would increase which successively will increase the demand for petrol.

4. Advertisement Expenditure:

Advertisement expenditure made by a firm to market the sales of its product is a crucial factor determining demand for a product, especially of the merchandise of the firm which provides advertisements. the aim of advertisement is to influence the consumers in favor of a product.

Advertisements are given in various media like newspapers, radio, and tv. Advertisements for goods are repeated several times in order that consumers are convinced about their superior quality. When advertisements prove successful, they cause a rise within the demand for the merchandise.

5. the number of Consumers within the Market:

The market demand for an honest is obtained by adding up the individual demands of this also as prospective consumers of an honest at various possible prices. The greater the number of consumers of an honest, the greater the market demand for it.

Now, the question arises on what factors the number of consumers for an honest depends. If the consumers substitute one good for an additional, then the number of consumers for the great which has been substituted by the opposite will decline and for the great which has been utilized in place of the others, the number of consumers will increase.

Besides, when the vendor of an honest succeeds find out new markets for his good and as a result the marketplace for his good expands the number of consumers for that good will increase. Another important cause for the rise within the number of consumers is that the growth in population. as an example, in India the demand for several essential goods, especially food grains, has increased due to the rise within the population of the country and therefore the resultant increase within the number of consumers for them.

6. Consumers' Expectations with reference to Future Prices:

Another factor which influences the demand for goods is consumers' expectations with reference to future prices of the products. If thanks to some reason, consumers expect that within the near future prices of the products would rise, then within the present they might demand greater quantities of the products in order that within the future they ought to not need to pay higher prices. Similarly, when the consumers expect that within the future the costs of products will fall, then within the present they're going to postpone a neighborhood of the consumption of products with the result that their present demand for goods will decrease.

Increase in Demand and Shifts in Demand Curve:

When demand changes thanks to the factors aside from price, there's a shift within the whole demand curve. As mentioned above, aside from price, demand for a commodity is decided by

incomes of the consumers, his tastes and preferences, prices of related goods. Thus, when there's any change in these factors, it'll cause a shift in demand curve.

An individual with a positive attitude towards a product/service offering is more likely to make a purchase; this makes the study of consumer attitudes highly important for a marketer. An attitude could also be defined as a sense of favorableness or unfavorableness that a private has towards an object (be it an individual, thing or situation). it's a learned predisposition to exhibit and act supported evaluation leading to a sense of like or dislike towards an object. In terms of consumer behavior, consumer attitudes could also be defined as an inner feeling of favorableness or unfavorableness towards a product or service offering and therefore the 4Ps. As Schiffman has defined, "Attitudes are an expression of inner feelings that reflect whether an individual is favorably or unfavorably predisposed to some "object" (e.g., a brand, a service, or a retail establishment)," and "Attitude formation, in turn, is that the process by which individuals form feelings or opinions toward other people, products, ideas, activities, and other objects in their environment".

In terms of consumer behavior, an attitude is reflective of a uniform favorable or unfavorable feeling that a consumer or an opportunity forms as a result of an evaluation about an object; the thing being, a product/service offering, brand, price, store and dealer, salesperson, advertisement, promotion etc. As Schiffman puts it, it's "a learned predisposition to behave during a consistently favorable or unfavorable way supported feelings and opinions that result from an evaluation of data about the object". It is noteworthy that attitudes can't be directly observed, the rationale being that they're impacted by psychographics like motivation, perception, and learning. Attitudes can only be inferred from what people say or what they are doing and the way they behave.

Attitudes represent our evaluations, preferences or rejections supported the knowledge we receive.

It is a generalized tendency to think or act during a certain way in respect of some object or situation, often amid feelings. it's a learned predisposition to reply during a consistent manner with reference to a given object.

This can include evaluations of individuals, issues, objects, or events. Such evaluations are often positive or negative, but they will even be uncertain sometimes.

These are the way of thinking, and that they shape how we relate to the planet both in work and out of doors of labor. Researchers also suggest that there are several different components that structure attitudes.

One can see this by watching the three components of an attitude: cognition, affect and behavior.

3 components of attitude are;

Cognitive Component.

Affective Component.

Behavioral Component.

Cognitive Component

The cognitive component of attitudes refers to the beliefs, thoughts, and attributes that we might accompany an object. it's the opinion or belief segment of an attitude. It refers thereto a part of attitude which is said generally knowledge of an individual.

Typically, these come to light in generalities or stereotypes, like 'all babies are cute', 'smoking is harmful to health' etc.

Affective Component

Affective component is that the emotional or feeling segment of an attitude.

It is associated with the statement which affects another person. It deals with feelings or emotions that are delivered to the surface about something, like fear or hate. Using the above

example, someone may need the attitude that they love all babies because they're cute or that they hate smoking because it's harmful to health.

Behavioral Component

Behavior component of an attitude consists of a person's tendencies to behave 'in a specific way toward an object. It refers thereto a part of attitude which reflects the intention of an individual within the short-run or end of the day.

The behavioral component reflects how attitude affects the way we act or behave. it's helpful in understanding their complexity and therefore the potential relationship between attitudes and behavior.

But for clarity's sake, confine mind that the term attitude essentially refers to the affected a part of the three components.

In a corporation, attitudes are important for his or her goal or objective to succeed. all of those components are extremely different from the opposite, and that they can repose on each other to make our attitudes and, therefore, affect how we relate to the planet.

Using the above example, the behavioral attitude maybe- 'I cannot wait to kiss the baby', or 'we better keep those smokers out of the library, etc.
